Entrust Product and Pricing Solution Notes

Below is a handy mix of Salesforce build specifications as well as business requirements from Entrust.

Considerations for m3ter implementation:

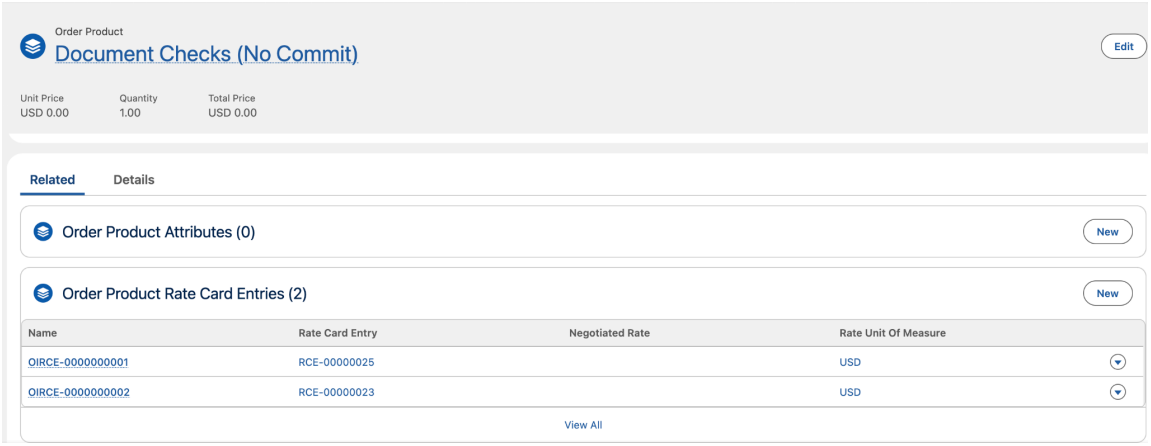

Overall, usage based products will be set up using Rate Cards/Rate Card Entries. Meaning every Product (Asset record, as it is currently designed) that is sent to m3ter will also have at least one Rate Card Entry record sent as well.

When the Quote is placed and it becomes an Order, each Order line item will have related records specifying the rates and their usage recources/”attributes” which will need to be sent to m3ter.

Asset will have related records for AssetRateCardEntries which should be sent to identify the agreed upon pricing.

*Why the negotiated rate shows as 0 is something I will work out, I expect it to have a value
*I expect that one-time/subscription products will NOT follow this model, though those will not need to be sent to m3ter and should be left off the integration so can disregard those for this purpose.

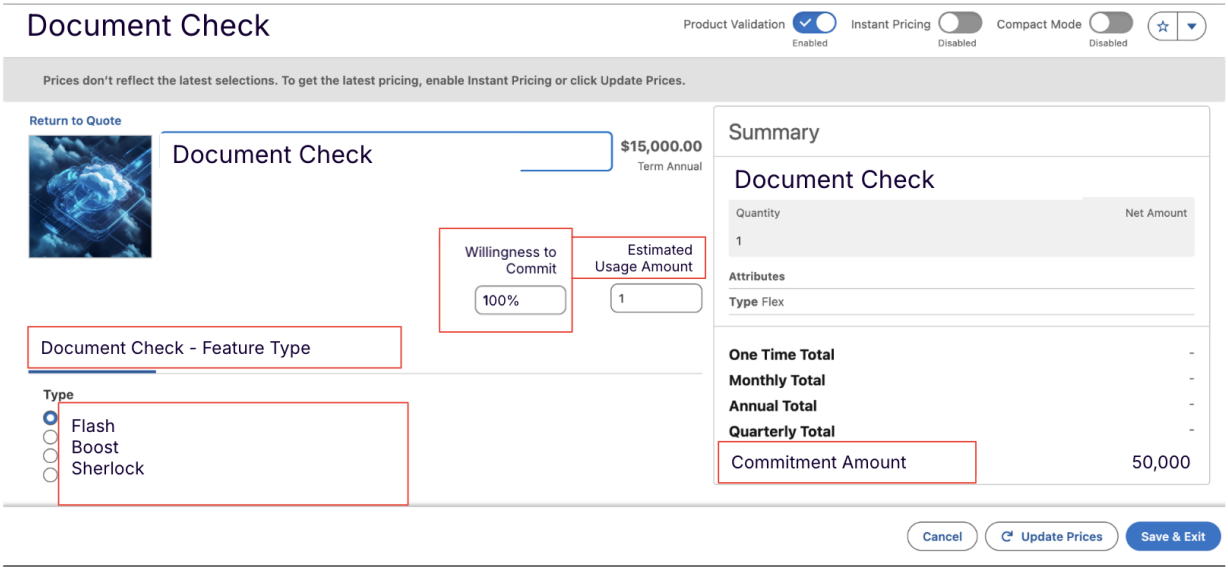

What happens if m3ter gets usage that isn't quoted?? (in the example that customer enables their own features and then should be billed the default usage)

Pricing Requirements plus the Quoting experience of said requirements:

User experience in the product configuration screen of the browse catalog experience:

- Custom field for "Estimated Usage Amount", to be populated where "quantity" shows up ootb
- Custom field for "Commitment Amount", to be displayed in the summary total screen
    - (This will never be a set amount and will be variable, thus we are leaning towards a custom field. Additionally, monetary commitments are not supported downstream so we do not see any impacts downstream at this time)
- Custom picklist field for "Willingness to Commit" with default value of 100%, additional incrementally decreasing percentages to be displayed.

Mockup of the intended interface:

Outstanding question: As described more below, Entrust would like a mechanism to populate a variable "Commitment Amount" on the product configuration screen. Because that 'flat rate amount' which should be used to populate the Commitment is in the Rate Card Entries and therefore is not applied to the product until it reaches the Quote Line Editor (to my knowledge?) can we use that value to be calculated in the pricing procedure on the product configuration screen?

3 ways of selling products:

1. Full commitment
    a. Only one single Rate card entry should be pulled in based on criteria, as this model will be the most discounted and will apply a flat rate for all usage.
    b. Need to have a commitment amount populated based on "Estimated Usage Amount" field * flat rate for that product. That would be the full amount.
    c. The Willingness to Commit field will default to 100%.
    d. The customer is billed the commitment amount up front based on their specified billing frequency.
    e. The customer will be charged any overages at the agreed upon rate card amounts after they consume all of their commitment.
2. Low commitment
    a. Need to have a commitment amount populated based on "Estimated Usage Amount" field * flat rate for that product. That would be the full amount.
    b. The Willingness to Commit field will default to 100%. The customer may object to paying that full amount. They may say "I will only commit to 10% of that". The sales rep will override the the Willingness to Commit picklist field to 10%. In which case, the graduated tier pricing structure applies, and the calculated

commitment amount should update based on the applicable rate in the applicable rate card entries

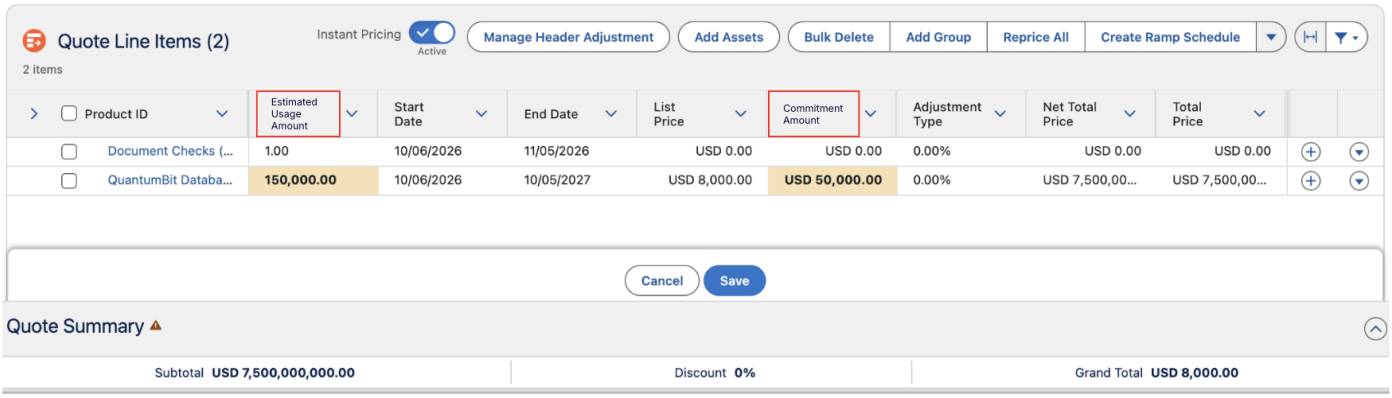

c. The customer is billed the commitment amount up front based on their specified billing frequency.
d. The customer will be charged any overages at the agreed upon rate card amounts after they consume all of their commitment.

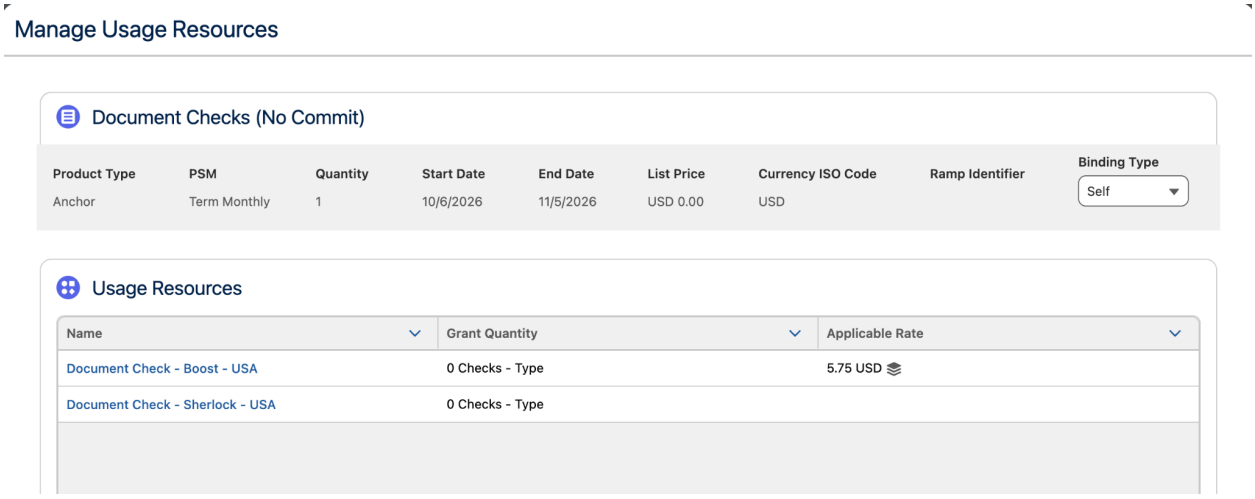

3. No commitment
    a. Need to have a commitment amount populated based on “Estimated Usage Amount” field * flat rate for that product. That would be the full amount.
    b. The Willingness to Commit field will default to 100%. The customer may object to paying any upfront commitment, which will put them in the PAYG model. The sales rep will override the Willingness to Commit picklist field to 0%. In which case, the graduated tier pricing structure applies, and the calculated commitment amount should update to $0.
    c. The customer is not billed anything up front based for that line item.
    d. The customer will be charged all usage at the agreed upon rate card amounts, and there will be no concept of drawdowns for this product.

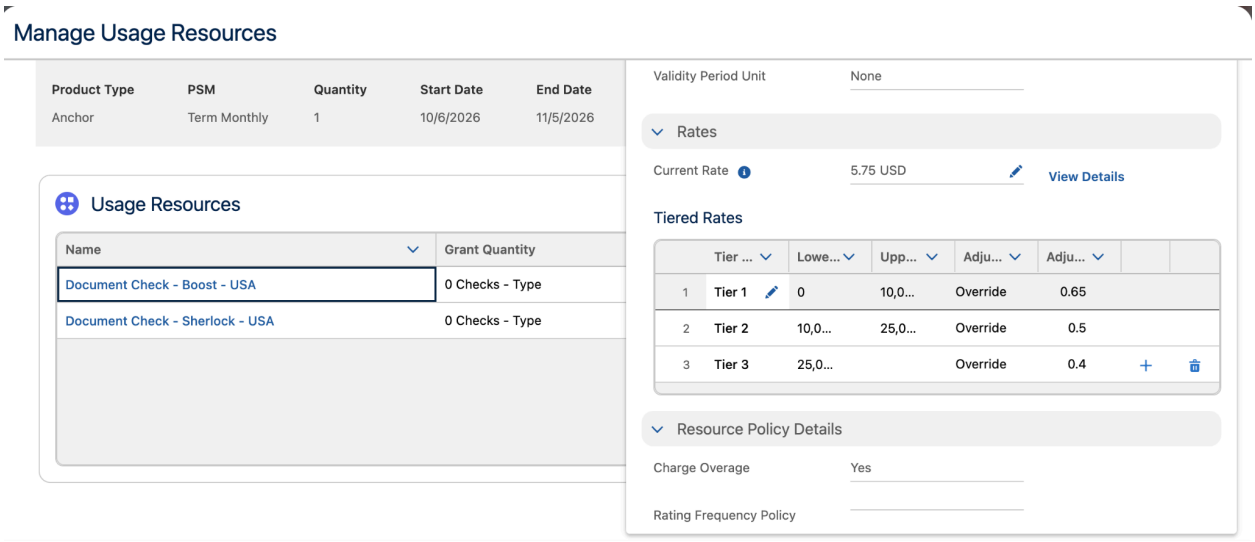

Outstanding question: Seeing as the above scenarios cover both pay in advance and pay in arrears (PAYG model), can we set the above up using one single product record as I have illustrated above? Does it need to be a separate product for the PAYG product? (Ideal quoting experience would be one single product)

After the commitment and estimated usage amount are set in the configuration screen, we would expect the sales rep to view/edit Rate Card Entries per the “Manage Usage Resources” screen as instructed by the SF team.

Mockup of the transaction line editor as well as the Manage Usage Resources screen:

Overview of Usage Resources which will drive Rate Cards:

A Usage Resource will be created for every combination of attributes/features which will require different pricing. This includes features which base pricing, such as the Document Check feature (Boost, Sherlock, Flash) or the country in which the Quote is being made for.

Today there are 7 “rate cards” (as they call them) in the Consumer IDV (Onfido) business, labeled by letters A-G which represent different countries/regions. A mechanism (custom metadata/formula) needs to be built to define what countries belong to what region or country within A-G so that the proper RCA Rate Card can be grabbed. It is unlikely that the Usage Resource attribute can be as straightforward as “US” or “UK”, but will more so be ‘regionally’

based Usage Resources with reference to a Quote field which defines which rate card a Quote should land in based on its quoted country.
